Worth noting in the Notes column

New birds, a hen that seems off, molting, very hot or cold days, and changes to feed or light. Penn State Extension says hens need 14 to 16 hours of light a day for top production, and about 10 to 12 weeks to finish a molt and start laying again. UNH Extension says short fall days, without added light, stop laying and bring on a molt. If a hen seems sick, ask your vet or your state extension office.
